The third round of Mapping and Size estimation of key populations was conducted under the leadership of the National Centre for AIDS and STD Control (NCASC), Ministry of Health and Population (MoHP) of the Government of Nepal. The survey was financially and technically supported by Save the Children International/Global Fund and Intrepid Nepal was the implementing agency for the survey. The survey was carried out under the expert guidance and supervision of Technical Steering Committee. They have played a pivotal role in survey deployment as well as reviewing and approving this report. I would like to extend my gratitude to the technical experts for their invaluable contributions throughout the different stages of the survey, including the design of the questionnaire and the training of field staff. The support and input from the study team and the technical working group are greatly appreciated.

I would like to extend my heartfelt appreciation to Dr. Sangita Kaushal Mishra, Director General of the Department of Health Services (DoHS), for her direction and guidance in completing the survey. Special thanks go to the entire NCASC team members for their coordination and support during the research. I would also like to thank Save the Children/Global Fund for funding the survey, with particular thanks to Dr. Rajya shree Nyachhyon (Kunwar) and the entire team for their unwavering support in ensuring the survey's timely completion. We are greatly indebted and appreciate the invaluable technical assistance we got for the project implementation from our international consultants, Dr. Ali Mirzazadeh and Dr. Ivana Bozicevic. Similarly, a special thanks go to the study team members of Intrepid Nepal for their valuable contributions to the high-quality field implementation of the survey: Rajesh Man Rajbhandari, Nischal Basnet, Prakash Bahadur Amatya, Bishnu Prasad Nepal, Bishwo Prakaram Shrestha, Dhirendra Shahi and Nisha Shrestha.

This survey would not have been possible without the immense efforts of our field researchers who conducted nationwide data collection and the key populations who generously shared their responses and valuable time. I extend my appreciation to all who coordinated and provided support to ensure the timely completion of the survey.

# Foreword

---

The 2023 Mapping and Size Estimation (MSE) of Key Populations in Nepal marks the third round of surveys conducted to generate national and sub-national size estimates of key populations. The first National level Mapping and Size Estimation of Key Populations was carried out in 2011, followed by the second in 2017. The 2023 MSE was carried out by Intrepid Nepal under the leadership and direction of the National Center for STD and AIDS Control, Government of Nepal, with Financial and Technical support from the Save the Children-Global Fund Nepal. A technical steering committee was responsible for coordination, oversight, advice, and decision-making regarding all major aspects of the MSE.

The purpose of the 2023 survey was to generate national and sub-national estimates of the populations of People Who Inject Drugs (PWID), Men Who Have Sex with Men (MSM), Transgender (TG) individuals, Female Sex Workers (FSW), and Male Labor Migrants (MLM) in Nepal. This survey provides empirical evidence to inform policy development and program design for HIV and AIDS prevention and control. The report estimates the size of key populations in selected districts and extrapolates these figures to estimate the populations at both sub-national and national levels.

Given the mobile nature of key populations, up-to-date information about their numbers and hotspots in each district is essential. Without this information, efforts to include key populations in HIV prevention programs or treatment, care, and support services could fall short. Accurate data on the size of key populations is crucial for guiding the national HIV response, as it serves as a foundation for shaping policies and programs. The results of this mapping exercise are expected to aid in program planning for key populations, policy formulation, and strategy development, contributing to targeted interventions and desired outcomes.

This report is dedicated to all participants, key population members, and stakeholders who have contributed to the national HIV response in Nepal.

# Executive Summary

## Introduction:

In Nepal, where HIV prevalence is concentrated in specific subpopulations, accurately estimating the size of key populations (KPs) such as people who inject drugs (PWID), men who have sex with men (MSM), transgender people (TG), and sex workers is crucial for effective intervention. As of 2023, an estimated 30,300 people were living with HIV in Nepal, with the country striving to achieve the 95-95-95 target by 2030. This survey aims to update and generate national and subnational size estimates of KPs in Nepal, using various methods to enhance resource allocation and intervention strategies. Accurate KP estimates are essential for informing effective national HIV and AIDS responses and meeting the set targets.

## Method

The mapping and size estimation exercise for KPs, including MSM, MSW, TG, PWID, and FSW, was conducted in 36 districts. In addition to geographical mapping, population size estimation methods such as Capture-recapture (CRC), network scale-up (NSU) and multiplier were used and further Bayesian modeling (called Anchored Multiplier) was used to synthesize the estimates.

This exercise focused on gathering relevant information directly from hotspots where key population members congregate. Key informant interviews were conducted with both KP members and non-KP informants familiar with the local situation around these hot spots. Districts were selected from each stratum to provide direct estimates for mapped districts and to inform extrapolated estimates for the remaining districts in the same strata.

As part of the mapping process, a comprehensive list of venues was compiled. These venues were places where KP members meet clients and other sexual partners or buy/obtain/inject drugs (in the case of PWID). Key informants associated with each hotspot were then interviewed to estimate the number of KP members who visit that hotspot weekly, their visit frequency, and their mobility patterns to other hotspots within the same district. Data collection for this survey occurred between May and June 2024. To ensure data quality, monitoring visits were conducted by the core research team and representatives from the technical working group. Following data collection, a validation meeting was held with key stakeholders to present the survey's findings. The goal of the meeting was to reach a consensus on the population estimates for each hotspot area and district. A technical committee, including national-level key stakeholders and representatives from KP networks, was formed to guide and facilitate the process, survey design, site selection for geographic mapping, and validation of population size.

## Data Management and Analysis:

Census and Survey Processing System (CSPro) was used to develop the CSentry CAPI questionnaire for collecting the data. The dataset was transferred to SPSS for data cleaning and further analysis. Data cleaning involved removal of any misreporting, discrepancies, outliers and inconsistencies. Adjustment factors (mobility adjustment, frequency adjustment and invisibility adjustment) were sequentially applied to all three KPs. The results were triangulated against the district specific 2023 programmatic reach data. The data analysis procedures were based on stratification and extrapolation, to estimate the number of KPs in mapped and unmapped districts and the entire country.

## **Geographical mapping KP Size estimation:**

- The national estimates of FSW are minimum 70,892 and maximum 86,809.
- The national estimates of MSM & TG are minimum 144,417 and maximum 163,820 of which minimum 30,549 and maximum 35,241 are TG, and minimum 73,725 and maximum 81,074 are MSM.
- The national estimates of PWID are a minimum of 39,844 and maximum 48,856. Among them, minimum 36,417 and maximum 44,372 are men and minimum 3,427 and maximum 4,484 are female.
- The national estimates of MLM are minimum 338,723 and maximum 544,480.

## **Conclusion**

This survey's findings can guide programme planners to develop better targeted HIV prevention strategies, in particular provision of HIV prevention at locations where KPs congregate and consequently enhance programme coverage. In addition, various levels of estimates that this survey provided (district, provincial and national level) should be used for target setting, planning the scale of HIV interventions and for advocacy efforts.

# CHAPTER I: INTRODUCTION

## 1.1 Background

At the end of 2022, there were an estimated 39 million people living with human immunodeficiency virus (HIV) and 630,000 HIV-related deaths, globally.<sup>1</sup> HIV is an incurable virus that attacks the immune system. While some individuals may not experience any symptoms after being infected with HIV, untreated, HIV may progress to into HIV Stage 3, commonly known as acquired immunodeficiency syndrome (AIDS), which is defined as the onset of opportunistic disease in people living with HIV (PLHIV).<sup>2</sup> HIV is transmitted when an infected person's bodily fluids containing sufficient viral loads of HIV comes in contact with the mucous membrane or damaged tissue of an uninfected individual.<sup>3</sup> HIV may also be transmitted from an infected mother to child at birth; however, this does not always occur. Due to the mode of transmission of HIV, infection commonly occurs through anal or vaginal sex or the sharing of needles, syringes, or other tools used to inject drugs.<sup>3</sup> While HIV is incurable, preventative methods such as condoms (and lubricants), pre-exposure prophylaxis (PrEP), and needle exchange programs, Opioid Substitution Therapy etc. are effective in controlling and preventing HIV transmission. Additionally, for PLHIV, antiretroviral therapy (ART) reduces viral loads of HIV to undetectable and untransmissible levels.

As of 2024, the status of the HIV epidemic in Nepal was “concentrated epidemic,” indicating low prevalence of HIV in the general population but higher prevalence in certain subpopulations. As of 2023, an estimated 30,300 people were living with HIV in Nepal with HIV incidence at 0.02 per 1000 population.<sup>4</sup> Nepal has established a 95-95-95 by 2030 goal as part of its national policy—i.e., 95% of PLHIV are aware of their status, 95% of PLHIV aware of their status undergo treatment, and 95% of PLHIV undergoing treatment successfully suppress the virus.<sup>5</sup>

Certain populations are at higher risk of HIV infection. These key populations (KPs) include sex workers, men who have sex with men (MSM), and people who inject drugs (PWID). In countries where HIV epidemics are concentrated, as in Nepal, it is crucial to determine the size of KPs to develop an effective national response to HIV and AIDS. However, accurately estimating the size of these populations can be difficult as many KPs are hidden and reluctant to reveal their identities.<sup>6,7</sup> In low- and middle-income countries, including Nepal, accurately measuring the size of KPs affected by concentrated HIV epidemics can be challenging due to the presence of stigma, discrimination, and criminalization of certain HIV-related behaviors. Quality data on the size of KPs through means such as census and routine data collection are often not readily available. In Nepal, HIV programs rely on the mapping and estimation process to identify geographical areas and prioritize interventions targeting KPs. KPs in Nepal comprise people who inject drugs (PWID), men who have sex with men (MSM), transgender people (TG), including transwomen (TW) and transmen (TM), sex workers, prison inmates, male labor migrants (MLM), and their spouses.

A robust estimate of the size of different key populations is required to guide the national response in HIV and AIDS. These includes census and enumeration methods, population survey methods, multiplier methods, nomination methods, capture-recapture methods, and multiple sample recaptures. Currently, Nepal is using the projected district level data of the 2016 mapping and size estimation for program planning and implementation. To make informed decisions about the allocation of resources for priority interventions and to improve the accuracy of coverage estimates for existing services, it is essential to have district-level estimates of the size of KPs

in Nepal. Such estimates can provide valuable insights into where resources are required and to what extent, helping to prioritize interventions and allocate resources effectively.

Hence, to achieve the 95-95-95 targets and expedite our response to HIV, it is crucial to update our understanding of the geographical concentration of key populations and their hotspots in the last five to six years. As these concentrations may have changed over time, it is essential to re-evaluate the size of these populations and their risk behaviors in each geographical area.

## 1.2 Objectives of the survey:

The overall objective of the mapping and size estimation is:

- To generate national and subnational level size estimates of People who inject drugs (PWID), Men who have sex with men (MSM), Transgender (TG), Female Sex workers (FSW) and Male labor migrants (MLM) in Nepal.

## Specific objectives

- Estimate the total key population sizes in the selected districts.
- Use the available data to extrapolate and estimate the size of key populations in all districts and to the sub-national and national level.

## 1.3 Epidemic Situation

The HIV epidemic in Nepal, beginning with the first detected case in 1988, has evolved from a low prevalence epidemic to a concentrated epidemic in certain key populations (KPs).<sup>8,9</sup> Key populations in Nepal include people who inject drugs (PWID), men who have sex with men (MSM), transgender people (TG), male and female sex workers (MSW and FSW), and male labor migrants (MLM) and their partners.<sup>8</sup> As of 2023, an estimated 30,300 people were living with HIV (PLHIV), of whom approximately 29,000 were aged 15 years and over.<sup>8</sup>

The primary mode of transmission in Nepal is heterosexual transmission, accounting for 69% of the incidence, while mother-to-child transmission remains low.<sup>8</sup> Members of KPs are at higher risk for HIV due to the practice of risky behaviors—including the sharing of needles or other injection equipment, unprotected sex with multiple partners, and inconsistent condom usage—and social stigma that poses a barrier to accessing HIV/STI-related health services.<sup>10</sup> The highest prevalence of HIV is among clients of sex workers (7.2%), followed by MSM and TG (4.7%), sex workers (2.5%), PWID (0.2%), migrants (0.2%), and partners of migrants (0.2%).<sup>8</sup>

To date, there have been 70,512 people infected with HIV and 29,518 AIDS-related deaths.<sup>8</sup> HIV is slightly more prevalent among men, compared to women.<sup>8</sup> The prevalence of HIV varies regionally across Nepal, with the highest prevalence rate of HIV in Bagmati province, followed by Lumbini, Sudurpaschim, Madhesh, Gandaki, Koshi, and Karnali.<sup>8</sup> As of 2022, of the PLHIV in Nepal, 23,362 were receiving ART, with generally high five-year ART retention rates (over 80%, on average).<sup>8,11</sup>

The incidence of new HIV cases and AIDS-related deaths have been steadily declining, with HIV incidence estimated to be 0.02% and an adult prevalence of 0.13%.<sup>12</sup> Since the first draft of the national policy on HIV/AIDS in 1995, the national strategy for the prevention and mitigation of Nepal's HIV epidemic is regularly updated with robust data on prevalence, indicators, and

access to and coverage of HIV health services.<sup>9</sup> The most recent National HIV Strategic Plan for 2021-2026 articulates a comprehensive framework for achieving the 95-95-95a targets associated with the UN's Sustainable Development Goals. At the end of 2019, Nepal achieved 86-77-64 coverage.<sup>13</sup> The 2021-2026 strategic plan highlights identifying and reaching key populations as a core strategy to achieve the 95-95-95 targets by 2030.<sup>9</sup> Thus, recent surveys have focused on identifying indicators, mapping, and population size estimation of KPs.

## 1.4 Implementation partners

Intrepid Nepal, a research agency, conducted the survey under the guidance of a technical working group led by National Center for AIDS and STD Control (NCASC) and consisting of various national and international organizations. Acting as the steering committee, the technical working group provided direction on finalizing mapping tools, oversaw the field work, ensured proper data management, and offered explanations to justify the results.

# **CHAPTER II:**

# **INTRODUCTION OF MAPPING**

## **2.1 Description of overall approach**

This survey aimed to generate both sub-national and national level estimates of the size of key populations targeted by HIV-related interventions managed at the district level in collaboration with national, local partners, and community organizations. The survey used program data from the selected districts as a primary data source, complementing data collected from the selected districts making them the as the unit of analysis. Due to logistical constraints, data collection focused on epidemiologically important districts where HIV-related interventions are implemented. To address gaps in data from districts without direct data collection, statistically robust extrapolation methods were applied to provide estimates for unmapped areas.

## **2.2 Rational mapping**

There are various methods for size estimate. Among these, mapping or census techniques are especially useful when local estimates are required for planning and monitoring programs. A limitation of mapping is that it only includes key populations (KPs) who are present and identifiable at physical venues. Nevertheless, it offers a reliable lower estimate of the KPs that programs can reach in these areas. Additionally, by incorporating a few extra questions during fieldwork, adjustments can be made to account for KPs who visit these venues infrequently or not at all. Therefore, to maintain consistency and support trend analysis, this round of population size estimation (PSE) also relies primarily on mapping methods.

## **2.3 Mapping approach**

In each selected district, the mapping process began by establishing rapport with local authorities and stakeholders to identify key informants and prioritize hotspot areas where key population (KP) members were likely to be found. In each priority area, Key informants were then asked to list specific hotspots where KPs such as FSW, MSM, TG, and PWID community gather. After obtaining a list of hotspots, key informants familiar with each hotspot estimated the weekly number of KPs who visited each location. They also provided information on the number of KPs from each hotspot who visited other hotspots and the number of hotspots they visited. This data was used to adjust for double counting.

Additionally, key informants estimated the frequency of KPs visit to these hotspots- daily, weekly, or less frequent basis (e.g., once a week, once a month or once in three months). This information helped adjust for less frequent visitors who might not be included in the weekly count. Finally, key informants estimated the proportion of KPs in the district who never visited the types of venues included in the mapping exercise, which helped estimate the hidden or less visible portion of the population. The data collected was then analyzed to develop a range of size estimates for planning programs and other activities.

## 2.4 Differences from the previous round of PSE

The 2024 mapping and Population Size Estimation (PSE) exercise was similar in its geographical mapping approach to the exercises conducted in 2010 and 2016, but it also introduced several new methodologies. A significant addition to this year's exercise was the incorporation of additional methods to estimate the size of the key population, includes the capture-recapture method, network scale-up, and service multiplier methods. Additionally, we also estimated the size of MLM population through secondary data analysis.

## 2.5 Survey Populations

The target populations for this survey and their definitions are as follows:

### 2.5.1 People who inject drugs (PWID)

The people who inject drugs are defined as "Those current injectors aged 15 years or above who have been injecting drugs for non-medical purposes in the 12 months prior to the date of the survey."

### 2.5.2 Men who have sex with men (MSM)

MSMs are divided into two groups; men who sell sex to other men (MSW) and those who have sex with other men but not for money or other commodities (non-MSW):

- a) **MSW** are defined as "Those males aged 15 years or above who have had sexual relations, (either oral or anal) with another male in the 12 months preceding the survey in exchange for money or other commodities."
- b) **Non-MSW** are defined as "Those males aged 15 years or above who have had sexual relations (either oral or anal) with another male in the 12 months preceding the survey without receiving a cash payment or other commodities."

### 2.5.3 Transgender (TG)

TG are defined as "those aged 15 years or above were born as biological males but who feel or dress as women or transwomen and had sex (oral or anal) with other men in the past 12 months. It includes two groups, transwomen who sell sex (TWSW) and those who have sex with other men but not for money or other commodities (non-TWSW):

- a) **TGSW** are defined as "TG aged 15 years or above who have had sexual relations, (either oral or anal) with another male in the 12 months preceding the survey in exchange for money or other commodities".
- b) **Non-TGSW** are defined as "TG aged 15 years or above who have had sexual relations (either oral or anal) with another male in the 12 months preceding the survey without receiving a cash payment or other commodities".

### 2.5.4 Female sex workers (FSW)

FSWs are women aged 15 years and above, reporting having been paid in cash or in commodities for sex (vaginal or anal) with men during the last 12 months.

### 2.5.5 Male labor migrants (MLM)

All the male labor migrants aged 15-49 years, having stayed continuously in India as a migrant worker.

## 2.6 Formative Assessment

Formative assessment (FA) was carried out before the PSE data collection to obtain the information needed for implementation of PSE, such as feasibility of carrying out various PSE methods, selection of districts for data collection and challenges that might be encountered during PSE. FA included a series of consultation meetings in each province to discuss feasibility of several PSE methods with community-based organizations (CBOs) and other stakeholders. It was carried out by a team of seven staff members and lasted two and half weeks.

During formative assessment CBOs and KP communities provided valuable information on the location of hotspots in districts, accessibility of KPs, changes in the number and distribution of hotspots and reasons for those changes. During this phase, data collection tools were developed, discussed with CBOs and community members, and piloted. Other important elements of the preparation phase included recruitment of field teams and training of field team members.

FA was carried out in the following provinces and programme districts:

- Koshi [Jhapa, Morang, Sunsari]
- Madhesh [Bara, Parsa, Rautahat, Sarlahi, Dhanusha, Mahottari, Siraha, Saptari]
- Bagmati [Kathmandu, Bhaktapur, Lalitpur, Kavrepalanchowk, Makwanpur, Chitwan]
- Gandaki [Kaski, Tanahun, East-Nawalparasi]
- Lumbini [Rupandehi, Kapilvastu, Dang, Banka, Bardiya, West-Nawalparasi]
- Karnali [Surkhet]
- Sudurpaschim [Kailali, Kanchanpur]

A separate report is available on FA. In brief, a total of 75 key informants (KIs) were interviewed: 26 from CBOs that provide services to PWID, 26 from CBOs that provide services to MSM and TG, and 23 from CBOs for FSW. Based on the findings from KI interviews, reaching KPs at hotspots is only feasible with the assistance of outreach workers (ORWs). Therefore, they had to be utilized during L2 field mapping and capture and recapture.

The findings regarding access to hotspots for each KP were as follows:

**PWID:** KIs reported that the number of PWID hotspots had increased in recent years. PWIDs often contact dealers through phones, collect drugs, and leave the sites immediately. KI interviews also revealed drug home delivery mechanisms through online portals like "Pathao" in urban cities such as Kathmandu and Lalitpur.

**MSM & TG:** The number of hotspots might be lower in certain districts compared to 2016, while there is also a certain number of new hotspots.

**FSW:** The number of FSW hotspots was reported to have decreased. It was reported that some of the previously known hotspots closed due to use of virtual platforms to meet clients.

In the sampled districts, a total of 1560 hotspots were identified for PWID, 1850 for MSM, MSW and TGW, and 1402 for FSW.

During FA, it was also assessed what services were provided to KPs by CBOs working at the district-level so that appropriate questions can be asked during PSE data collection. Additionally, it was determined whether CBOs can provide unduplicated counts of KPs that received services during December 2023-May 2024, which is needed for the service multiplier method.

In terms of virtual platforms, FSW and PWID use Facebook messenger groups and WhatsApp while MSM and TGW use platforms such as Snapchat, Emo, Grindr, Tinder.

Based on the data collected during the FA, districts for PSE data collection were purposefully selected based on a combination of factors, including the number of hotspots, estimated population size reported by KIs, existing HIV programs/services, local staff capacity, and the feasibility and cost of implementation. It was decided to include 16 districts in PSE from all 7 provinces, including the capital of Kathmandu.

Based on the FA findings, the following PSE methods were selected for implementation:

- Geographical mapping
- Three source capture-recapture
- Multiplier method
- Network scale-up

## 2.7 Eligibility criteria for Key informants

### 2.7.1 KP Key informants

KP Key informants were required to be;

- i) be age of 18 or above.
- ii) be familiar with the hotspot.
- iii) be active KP members who had got engaged in the behavior of interest (sex work, injecting drug use, anal intercourse).

### 2.7.2 Non-KP Key informants

Non-KP Key informants were required to be;

- i) be age of 18 or above.
- ii) be familiar with the hotspot.

Examples of Non-KP Key informants include:

- People who worked at the hotspot or nearby such as establishment owners/ managers (e.g. Bars, hotels, lodges, clubs etc.),
- People who were hosts/hostesses, security personnel (bouncers) or customers at the establishments,
- People who owned shops or stalls nearby to the hotspot and interacted with people visiting the hotspot, and
- Pimps, Taxi drivers, or NGO outreach workers.

# CHAPTER III:

# POPULATION SIZE ESTIMATION

## METHODS

The 2024 Population Size Estimation (PSE) exercise followed a geographical mapping approach similar to the 2010 and 2016 exercises. In addition, three other methods were used to estimate the size of key populations: the capture-recapture method, network scale-up, and service multiplier methods. The size of the MLM population was also estimated through secondary data analysis.

### 3.1 Survey Sites for Geographical mapping

The objective of this survey was to conduct Population Size Estimation (PSE) for key populations targeted by HIV-related interventions across districts in Nepal, excluding certain remote hilly and mountainous areas. Following a formative assessment and consultations with stakeholders, the mapping and size estimation exercise was carried out in selected districts for Female Sex Workers (FSW), Transgender individuals and Men who have Sex with Men (TG/MSM), and People Who Inject Drugs (PWID). The mapping covered all designated program districts for each population group across Nepal's seven provinces, as well as additional non-programme districts used as proxy sites to extrapolate estimates for unmapped areas. The survey sites for geographical mapping and size estimation are listed below:

**FSW:** 26 program districts and 6 non-program districts as a proxy district for extrapolation of unmapped districts.

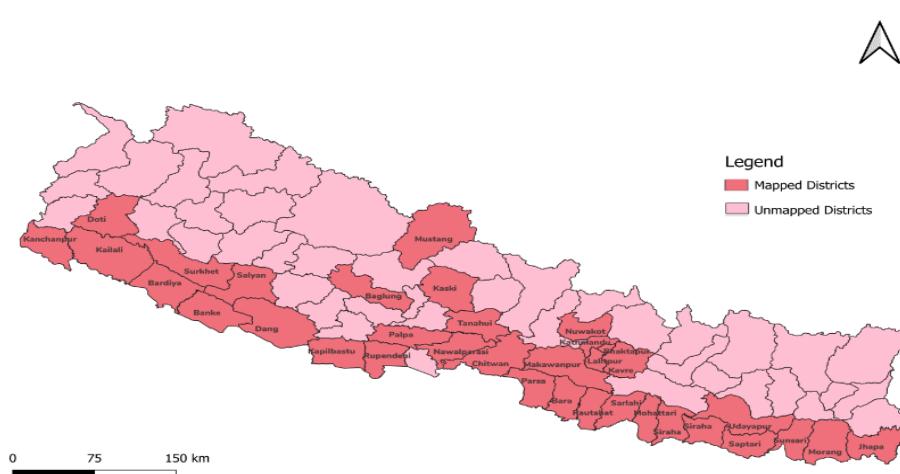

**TG/MSM:** 27 program districts and 6 non-program districts as a proxy district for extrapolation of unmapped districts.

**PWID:** 27 program districts and 5 non-program districts as a proxy district for extrapolation of unmapped districts.

**Table 1: Selected districts for geographical mapping (Program and Proxy districts)**

Province	District	Type	FSW	TG/MSM	PWID
Koshi	Jhapa	Program	✓	✓	✓
	Morang	Program	✓	✓	✓

[Note: The selected districts were all HIV program intervention districts with few additional proxy districts]

## 3.2 Survey Sites for Service Multiplier, Network Scale-Up, and 3-CRC Method

These exercises were conducted in nine districts, nine each for FSW and TG/MSM and ten districts for PWID:

**Table 2: Survey Sites for Service Multiplier, Network Scale-Up, and 3-CRC Method**

FSW	TG/MSM	PWID
Jhapa	Morang	Morang
Dhanusha	Dhanusha	Dhanusha
Bara	Parsa	Parsa
Kathmandu	Kathmandu	Kathmandu
Makwanpur	Lalitpur	Makwanpur
Kaski	Nawalparasi_E	Kaski
Nawalparasi_W	Rupandehi	Nawalparasi_W
Banke	Dang	Banke
Kailali	Kailali	Surkhet
-	-	Kailali

## 3.3 Data collection approach

### 3.3.1 Geographical mapping

Geographical mapping was conducted via multiple steps, including:

- Pre-mapping preparations.
- Level 1 mapping.
- Level 2 mapping (during the first capture).
- Second and third captures of some hotspots selected at random.

#### 3.3.1.1 Pre-mapping

Pre-mapping activities were conducted prior to Level 1 mapping. Meetings with national-level community network stakeholders for key populations streamlined the process before mapping exercise. The objectives of pre-mapping were to:

- Establish rapport with district level authorities and local stakeholders to identify different types of hotspots where key population members could be found within the district.
- Obtain lists of hotspots for each key population from NGOs that carry out HIV prevention outreach.
- Understand the types and profile of existing hotspots and the assess their accessibility to field teams as some spots are located indoors (in particular for FSW) and the majority outdoors.
- Identify potential key informants for L1 mapping.

Here, stakeholders and local authorities included:

- HIV focal persons at the local level.
- Representatives of the District Police office.
- Motivators (members of the KP community who could help to access the community).

- iv) Peer educators from the community network who helped identify hotspot areas in the district.
- v) Key informants who were able to provide detailed information about specific hotspots.

### **3.3.1.2 Level 1 mapping at the district level**

The Level 1 mapping was conducted at the district level to create a comprehensive list of hotspots in the districts.

- We developed a list of hotspots by interviewing both KP and non-KP key informants (KI), and each KI asking each informant to name the hotspots they were familiar with.
- For each reported hotspot, we collected the information's on the minimum and maximum number of the key population visiting during peak times.
- Through the Level 1 mapping, we created a master list of the hotspot for each district including location and size.
- Hotspots mentioned by multiple key informants were cross referenced to eliminate duplicate thereby resulting in a unique list of hotspots with unique hotspot identification numbers.

*Key data collected in L1 included:*

- Hotspot name and address.
- Minimum estimates of KPs (average of All minimums mentioned by KIs).
- Maximum estimates (average of ALL maximums mentioned by KIs).
- Population types accessing the hotspots.

### **3.3.1.3. Level 2 mapping at the district level**

Level 2 mapping at the district level involved the following steps:

In the first round, all hotspots reported by key informants (from the table above) were visited. For rounds two and three, data were collected by visiting a maximum of 50 randomly selected hotspots.

Level 2 mapping was the process of collecting detailed information about the presence of KP members at hotspots identified in Level 1 mapping. At each hotspot, we conducted interviews with KPs and asked them to estimate the number of KPs who visited the hotspot during peak times. The purpose of this hotspot verification was to update the status of each hotspot in the L1 master. Specifically, we aimed to:

- Confirm that the hotspot existed and was operational.
- Confirm that the hotspot was unique (i.e., not a duplicate of another hotspot).
- Verify the location/address of the hotspot.
- Record the GPS coordinates of the hotspot.
- Obtain estimates of the minimum and maximum number of KPs that visited hotspots during an average week.
- Enumerate the number of KPs present during each hotspot visit.

- Obtain adjustment factors for mobility across the hotspots and the proportion of each KP that did not visit hotspots (i.e., the proportion of the population that was “hidden”).

Since the capture-recapture method required venue visits, the first capture was used to collect L2 information to carry out the survey effectively. The capture -recapture exercise was done only in province-wise selected districts.

### **3.3.2 Service multiplier**

Data for the service-based multipliers were part of data collection forms completed during mapping and CRC. Respondents were asked whether they received the following services from CBOs:

- Condoms from CBOs in December 2023 - May 2024.
- HIV testing from CBOs in December 2023 - May 2024.
- Syphilis testing from CBOs in November 2023 - April 2024 (asked to MSM, TGW and FSW).
- Sterile needles and syringes from CBOs in December 2023 - April 2024 (asked to PWID).

The second data source for the multiplier method was the unduplicated count of KPs that were given the above-mentioned services at the same time-period. These data were obtained from program implementing organizations through CBOs.

### **3.3.3 Capture-recapture (CRC)**

Field-based - CRC is used to estimate the size of KPs that are accessible at outdoor venues (hotspots). CRC consists following steps i.e. i) visiting hotspots where KP members congregate on two or more separate occasions (captures), ii) tagging (i.e. marking) all KP members found at the hotspots on each capture, iii) calculating the extent of overlap, and iv) generating a size estimate. There has to be direct contact between data collectors and KP members, and the eligibility of a person must be confirmed before a person can be tagged.

Capture–recapture is feasible for populations that are mobile and less appropriate for more stationary populations who frequent hotspots at fixed times according to fixed patterns (for example brothel-based sex workers).

CR with three samples (3S-CR) is a more valid approach compared to 2 S-CRC as it relaxes the assumption of independence and allows for more sophisticated analysis resulting in more accurate PSE.<sup>14,15</sup> More than two captures increase the number of data points from which estimates are generated, generally resulting in more stable and robust size estimate. By using Bayesian methodology, independence between captures can be accounted for. This method was successfully implemented in several settings such as Uganda, South Sudan and Ghana.<sup>16,17</sup> In CRC studies it is important to correctly identify KP members who participated in each phase of the survey. This is achieved by giving participants some memorable objects like key chains or bracelets during each phase as “tags”.

KPs were sampled in this survey during three independent captures. The first capture was geographical mapping while the 2<sup>nd</sup> and the 3<sup>rd</sup> capture included 50 randomly selected hotspots. All three captures were set one week apart to minimize the effect of migration.

The process of implementing 3S CRC method was as follows:

In this survey, KPs (PWID, MSM, FSW, TG) were each sampled during three independent captures. Each capture was set one week apart to minimize the effect of migration in and out of selected geographical areas. Unique objects (picture- Mountain (Capture 1) and Rhino (Capture 2)) were given to KPs that people could easily carry with them. The types of objects to be given were decided during the formative assessment by interviewing KPs. Each team who went for capture-recapture consisted of two field enumerators.

- **First capture:** Hotspots were visited in programmatic mapping. When at a hotspot, interviewers firstly visually identified individuals thought to be KP members, then approached them and asked in a sensitive manner whether they belong to a KP.

After determining eligibility, an object was given to a KP member. Those approached member could either accept or refuse the object, and both events were recorded. KP members were instructed to keep the unique objects with them for the next 2 weeks and not to give it away.

**Second capture:** Re-visits to all the hotspots were done one week after capture 1. Interviewers recorded data on the number of persons who accepted objects during the second visit and the number of those who reported receiving the object in capture 1. KP members were asked to show objects they had received. In case that someone reported receiving the object but could not show it, they were asked to identify the correct object from a laminated card with the distributed unique objects mixed with several incorrect objects (some similar to the real objects, some very different). Recaptures were persons who could show the object or identify it from a set of pictures.

- **Third capture:** Here, re-capture implies re-visits to all the hotspots one week after the second capture. After approaching people at hotspots and assessing eligibility, interviewers asked respondents whether they got unique objects in captures 1 and 2 and asked them to show/ recognize the objects.

The objects distributed included two different photos (nature and animals) and were the same for all KPs.

Each field team consisted of two staff members (an interviewer and a member of a KP community) who knew well the target population and had experience in working with the target population.

### 3.3.4 Network Scale Up

Network scale up (NSU) was done as part of the household survey of male labor migrants conducted in spring 2024. In NSU, members of the general population such as male labor migrants (not necessarily KP themselves) are asked about the overall number of members in their network and the number of KP they know in their networks. If this question is asked to a large representative number of people in a community, the collective information can provide a robust estimate of the KP population size as a whole. The advantages of NSU are 1) It does not require a survey of KP itself, 2) It can estimate more than one KP in one round, 3) It can be integrated into national surveys among general populations and so produce national counts.

To perform NSU data analysis, the following questions were added to the data collection form for capture-recapture of PWID, MSM, TGW, and FSW to measure and adjust the NSU estimates for two possible biases: "Transmission bias" and "Barrier effect".

The following questions were asked in the capture-recapture:

- How many adult men do you know who worked in India for some time during the last 3 years?
  - How many of those know that you are injecting drugs (for PWID), sell sex (for FSW), have sex with other men (for MSM and TGW)?
- How many adults do you know who are divorced or permanently separated?
  - How many of those know that you are injecting drugs (for PWID), sell sex (for FSW), have sex with other men (for MSM and TGW)?
- How many medical doctors (including specialists) do you know?
  - How many of those know that you are injecting drugs (for PWID), sell sex (for FSW), have sex with other men (for MSM and TGW)?
- How many women do you know who gave birth in 2023?
  - How many of those know that you are injecting drugs (for PWID), sell sex (for FSW), have sex with other men (for MSM and TGW)?
- How many people do you know who are on kidney dialysis?
  - How many of those know that you are injecting drugs (for PWID), sell sex (for FSW), have sex with other men (for MSM and TGW)?

By "know", we mean that a respondent knows them, and they know a respondent by sight or by name, that a respondent could contact them, that they live within Nepal, and that there has been some contact between a respondent and them (either in person, by telephone or mail) in the past year.

## 3.4 Data collection period

The field work started on May 2<sup>nd</sup>, 2024, and was completed on June 7<sup>th</sup>, 2024.

## 3.5 Data Collection Tools

To ensure the collection of valid and reliable information during the survey, we used objectively designed and pre-tested tools. These mapping tools, including questionnaires (both in English and Nepali), consent forms (both in English and Nepali), data collection forms, and other necessary instruments. Extensive consultation was conducted with various stakeholders while developing the research instruments.

The developed tools were reviewed by the SCI and NCASC team and other key stakeholders. Feedback from the review was incorporated into the final version tool. The finalized tools were digitized in tablets using CAPI. While developing the tools in the e-application of the tablets, all the skip patterns, responses, and legal values were well-defined within the electronic data recording system.

The questionnaire covered topic related to; capture-recapture, service multiplier and network scale-up.

## 3.6 Recruitment and training of field team

Field team members were recruited from the list of researchers with the prior experience in collecting data in similar setting with similar survey populations. A two-day training course (including one day for field practice and pre-testing of tools) was conducted in Kathmandu for

the members of data collection team. Following the main training, six field teams were formed to implement the research. In total there were six field supervisors and thirty-four enumerators.

The entire team was centrally supervised by the field manager. Teams were formed considering the four different key populations, i.e., PWID, MSM, TG, and FSW. Each team and location involved in the mapping exercise included members of the respective KPs to assist in identifying hotspots and creating an enabling environment for interviews and data collection.

## **3.7 District-level validation meetings**

After data collection was completed in each district, the research team conducted a validation meeting with key stakeholders to present the findings. Members of the local networks of KPs and local intervention agencies were invited to the validation meetings. The purpose of the meetings was to reach a consensus on the estimates of each population hotspot area and the hotspots in each district.

## **3.8 Data Management, Entry, and Analysis**

### **3.8.1 Data entry**

The database was designed using Census and Survey Processing System (CSPro) with built-in checks for data entry errors (inconsistent or invalid data) and enabling skip patterns as designed in the data collection forms.

### **3.8.2 Data cleaning**

After the completion of the data entry in each district, the data set was checked once again by running simple frequency tables. Then the data sets were transferred into SPSS for further cleaning and analysis. The following things were checked and fixed as necessary:

The following things were checked and fixed when necessary:

- During data collection, the responses to questions were given in ranges. The data were checked to confirm that the minimum values did not exceed the maximum values.
- To correct for mobility, respondents were asked about the estimated number of KPs at hotspots where they were being interviewed, they were also asked about other hotspots in district visited frequently, and the number of other hotspots they might visit.
- It was made sure that the estimated number of KPs who visited other hotspots did not exceed number of KPs who visited the hotspot where the interview was conducted, because the question asked referred to the KPs from that hotspot only.
- It was confirmed that the estimated number of other hotspots visited did not exceed the number of hotspots that were mapped in the district.

In order for the mobility adjustment to function properly, these two conditions needed to be

- To correct the frequency of visits to hotspots (which was measured on average of daily, weekly times per month, or less frequently). The totals of these values had to add up to the unadjusted size estimate for the spot in order for the frequency adjustment to function properly. In cases where they did not add up, the two were forced to match by modifying the original unadjusted size estimate.

## **3.9 Development of District Level Estimates (For Geographical Mapping)**

We have utilized different approaches for district, province and national level estimation.

### **3.9.1 Consolidation of multiple responses and removal of outliers**

There were four different key informants for each hotspot. To finalize the estimates, the responses of the four respondents was consolidated. Often, this was done by taking the mean value across respondents. However, in cases where one response was significantly different from the other responses, the outlier value was brought into line with the acceptable upper limit of values for the district.

### **3.9.2 Calculation of unadjusted estimates and adjusted estimates**

Four sets of numbers were calculated for each district based on the consolidated data from each spot. The first was the unadjusted estimate, and the other three were calculated by applying adjustment factors derived from the data collected during the mapping fieldwork.

**Table 3. Description of adjustment factors**

<b>Adjustment</b>	<b>Process</b>
Unadjusted hotspot level estimates	Number of KPs likely to be found at each hotspot over the course of a week – which can be used for planning and monitoring outreach activities. (Note: Depending on the amount of movement between hotspots, the same people may be found at multiple sites, so these numbers cannot be directly used to measure the coverage).
District level estimates adjusted for double-counting	This estimate represents the total number of KPs likely to be found at all hotspots in the district over the course of one week, after accounting for double counting. It can be used to set weekly targets and measure weekly coverage for the district.
District level estimates adjusted for double counting and frequency of visiting hotspots	This estimate represents the total number of KPs reachable at hotspots in the districts over a period of several weeks or months. Because this estimate accounts for people who visit hotspots regularly, and those who visit less frequently, it can be useful to measure cumulative numbers of KPs reached by programs over time (e.g. quarterly, annual figures).
District level estimates adjusted for double counting, frequency of visiting hotspots and percentage of who do not visit hotspots	This estimate represents the total number of KPs in the district including both of those who come to hotspots frequently and those who do not. It also includes the less visible KPs who may not come to hotspots at all, or who may be less visible, and consequently, less reachable target population by the program.

## **3.10 Estimation steps**

Estimates obtained from interviewing primary KIs during Level 2 field work were taken as the final unadjusted estimates. Hotspot estimates were generated by averaging the median/ minimum/maximum estimates provided by informants interviewed. District-level unadjusted estimates were obtained by summing across hotspot estimates.

An adjustment for mobility was done to reduce double counting of KPs frequenting multiple hotspots.

The following formula was used to adjust for mobility:

$$S_2 = S_1 (1 - O_1) + (S_1 * O_1 / m_1)$$

Where:

- $S_2$  = estimated number of KP individuals at a hotspot adjusted for mobility.
- $S_1$  = crude number of KP individuals at a hotspot .
- $O_1$  = proportion of KP individuals that visit more than one hotspot on a peak day.
- $m_1$  = mean number of hotspots that KP members visit on a peak day.

The following formula was used to further adjust for the frequency of visits to a hotspot:

$$S3 = (S_2 \times P1 \times W1) + (S_2 \times P2 \times W2) + (S_2 \times P3 \times W3) + (S_2 \times P4 \times W4) + (S_2 \times P5 \times W5)$$

Where:

- $S_2$  = Mean number in a week adjusted for mobility.
- $P1$  = % visit at least once a week.
- $P2$  = % visit every other week.
- $P3$  = % visit around once a month.
- $P4$  = % visit around once in 3 months.
- $P5$  = % visit less than once in 3 months.
- $W1$  = weight of at least once a week = 1.
- $W2$  = weight of every other week = 2.
- $W3$  = weight of around once a month = 4.
- $W4$  = weight of around once in 3 months = 12.
- $W5$  = weight of less than once in 3 months = 24.

The following formula will be used to further adjust for the population that is hidden:

$$S4 = S3 / (1 - q).$$

Where,

- $S4$  = estimated number of KP individuals at a venue adjusted for mobility, frequency, and the hidden population.
- $S3$  = number of KP individuals at a venue adjusted for mobility and frequency.
- $q$  = proportion of KP individuals that are hidden, i.e., do not visit venues that are mapped.

### 3.11 Triangulation with other data sources

After calculating the adjusted and unadjusted mapping estimates for each district, they were compared with other available sources, particularly district-specific program reach data, to evaluate their validity and plausibility.

The sources of district specific program reach data are;

1. 2023 district specific program reach data from Save the Children Nepal.
2. 2023 district specific program reach data from FHI 360.
3. Program and estimated data from Key population specific Community based organizations (CBOs).
  - Blue Diamond Society (BDS)
  - Recovery Nepal (RN)
  - Jagriti Mahila Maha Sangh (JMMS)
  - Migrant Network

## 3.12 Extrapolation of the population size

The extrapolation of the findings for all four key populations (PWID, MSM, FSW, TG) was done for all districts, provinces, and the whole country.

Regarding the geographical mapping data, the method of extrapolation was used to calculate the proportion of adult males (in case of MSM and PWID) and the proportion of adult females (in case of FSWs) in the mapped district, and then multiplied that proportion by the number of adult males and adult females (respectively for MSM, PWIDs and FSW) in the unmapped district. The formula used for this is shown below in equation. Each unmapped district was matched with a mapped district thought to be most similar to it and used for extrapolation purposes according to the formula below. We also consulted with the experts (responsible for implementing the program at district level) to identify the similar districts (in terms of burden of HIV, risk behaviors and other geographical representation) for extrapolation. The final extrapolation processes are described in the results chapter.

**Equation:** Extrapolation Formula

$$E = N * P$$

Where,

E = Estimated number for unmapped district

N = Estimated number of mapped districts used for extrapolation

P = Population proportion of unmapped district

## 3.13 Process of Capture-recapture

The following are the main outputs of the descriptive analysis:

- Number of individuals approached in capture 1, 2 and 3 per KP.
- Number and percentage of individuals who met eligibility criteria out of those approached.
- Number and percentage of KP members who accepted an object in captures 1 and 2 among those found to be eligible.
- Number and percentage of approached in the same capture who were already approached by field teams in captures 1, 2 and 3.
- Number of KP members who reported receiving the object in capture 1 and capture 2, out of those interviewed in captures 2 and 3.

Data analysis was done in [Multiple Source Capture Recapture Analysis \(epiapps.com\)](#) using Bayesian 3S CRC approach, the non-parametric latent class models to estimate the KP sizes. Shiny recap, the Multiple Source Capture-Recapture Analysis Software was developed using the Shiny web framework for R.<sup>18,19,20</sup> Final size estimates were based on a Bayesian approach to accommodate the complex patterns of heterogeneity between captures and aggregation of homogenous strata into latent classes. The PSE and the corresponding 95% credible interval (CI) were calculated.

### 3.14 Process of Service Multiplier

The following formula was used for PSE based on the multiplier method:

$$N = M/P$$

Where,

N=Estimated size

P=Percentage of KP members interviewed in geographical mapping and capture-recapture who reported receiving certain service during a specific period.

M=Number of KP members who received a certain service by CBOs in the same time-period.

A 95% confidence interval (CI) is calculated as:  $95\% CI = N \pm 1.96 \sqrt{Var(N)}$

The following formula was used to calculate  $Var(N)$ :

$$Var(N) = \frac{Var(M)}{[E(P)]^2} + \frac{[E(M)]^2}{[E(P)]^4} Var(P)$$

Where,

- N=Population size estimates
- M= Number of KPs who received services of CBOs (CBO data), which has a Poisson distribution.
- E (P)= Proportion of KPs who reported receiving a service in mapping and CRC
- E (M)= Number of MSM who received a service (CBO data)
- Var (M)=As it has a Poisson distribution, Var(M) is equal to M.
- Var (P)= The variance of the proportion of KPs in mapping and CRC

### 3.15 Process of Network Scale-up

To conduct NSU data analysis, questions were added to the data collection form for the capture-recapture survey of PWID, MSM, TGW, and FSW. These questions aimed to measure and adjust for two potential biases in NSU estimates:

- **Transmission bias:** The likelihood that KP members were underrepresented in general population networks.
- **Barrier effect:** The degree to which certain social barriers limited the visibility of KP members in general networks.

The Network Scale-Up (NSU) method estimated the size of a hidden population (e.g., key populations or KPs) by asking general population members about their social networks. Here's the basic formula used in NSU:

$$N = \frac{\sum_{i=1}^n \frac{e_i}{m_i}}{n} \times T$$

Where,

- $N$  = Estimated size of the hidden population (e.g., KP population)
- $n$  = Number of people surveyed (respondents)
- $e_i$  = Number of people in the hidden population known by respondent  $i$
- $m_i$  = Total size of respondent  $i$ 's personal network
- $T$  = Total population of the area being studied (e.g., the district or national population)

#### Explanation of Each Component:

1. **Personal Network Size ( $m_i$ ):** Each respondent's total network size was typically estimated by asking how many people they knew in specific categories (e.g., people they could invite to a wedding), which provided an approximate measure of their network size.
2. **Known Members of the Hidden Population ( $e_i$ ):** Respondents were asked how many people they knew within the hidden population (e.g., people who inject drugs, MSM, TG, FSW).
3. **Average Ratio Across Respondents:** The ratio was calculated for each respondent and then averaged across all respondents to obtain a general estimate.

**Adjustments for Biases:** Two main biases could affect NSU estimates:

- **Transmission Bias:** This occurred if people in the general population were less likely to know members of the hidden population.
- **Barrier Effect:** This occurred if social stigma or other barriers prevented general population members from knowing people in the hidden population.

To address these biases, correction factors were applied based on responses to additional questions that measured visibility and access barriers for each KP.

$$N_{\text{adjusted}} = N \times \text{Correction Factor}$$

The final adjusted NSU estimate was then calculated. This adjustment helped improve accuracy by accounting for potential underestimation of KP members due to social or visibility constraints in respondents' networks.

## 3.16 Bayesian modeling anchored multiplier

Bayesian modeling (called Anchored Multiplier) is used to synthesize all estimates into one population size estimate. The Anchored Multiplier method synthesizes multiple estimates of the size of a population into a single estimate. It uses a Bayesian modeling framework to combine empirical estimates (e.g., population size estimates from different methods) with a prior belief (e.g., an estimate from a previous survey in Nepal). The calculator fitted the data input to a beta probability distribution that reflects the certainty (i.e., the strength) of the data point. Data points with narrower confidence intervals will have a greater influence on the final estimate than data points with wider confidence intervals. When there is additional variance between the estimated population sizes entered that needs to be considered, the calculator will also provide the variance-adjusted estimate ("Anchored Multiplier-VA"). For the prior, we used the population size estimated for key populations in Nepal in 2016.

Following data were used for the Bayesian synthesis:

- Prior PSE from 2016
- Service multiplier estimates
- CRC
- NSU
- Geographical mapping

Census data were used to calculate the percentage of KPs in the general population. The weight of the prior was reduced by increasing the width of 95%CI by a factor of 4.

Results of each of the method that were statistically less than the program counts 95%CI were not included in the Bayesian synthesis.

### **3.16.1 Extrapolation of the population size for Bayesian Model**

After estimating the population size for the districts where data was collected for PSE/Mapping using Bayesian modeling, we used Lasso regression with a Poisson family with a log-link function and adult population as an offset to select the best proxy predictors (among several candidate predictors including employment, poverty, education, arrest, etc.) for the extrapolation of the population size of the studied districts to (unobserved) districts where we did not directly collect PSE/Mapping data.

After estimating the population size for the districts where we collect data for PSE/Mapping by the Bayesian modeling, we use stratification for the extrapolation of the population size of the studied districts (mapped) to unstudied districts (unmapped districts) where we did not directly collect PSE/Mapping data. If the results of a mapped district were zero, we replaced zero with the minimum population size estimated resulted from Bayesian synthesis. For example, for FSW population, the minimum PSE was from Jhapa district (0.27%, 95%CI 0.24 to 0.32). And we used this minimum % for any districts that the PSE was zero from mapping. The stakeholder and expert opinion were base of our stratification (to choose from what mapped district we need to borrow the PSE).

### **3.17 Estimation process for MLM**

Regarding the MLM size estimation, secondary data analysis was done based on the census data, 2021 obtained from National Statistical Office (NSO) and other secondary sources i.e. International Organization for Migration (IOM), 2023. Baseline Study on Cross-border Migration. IOM, Kathmandu and Nepal Demographic and Health Survey 2011, 2016, and 2022 Population Division Ministry of Health and Population Government of Nepal Kathmandu.

The steps followed for the secondary data analysis are as follow;

- The 2021 census shows that a total of 2,190,592 persons from 1,555,961 households (23.4%) are absent and living abroad. Out of the total absentees living abroad, 1,799,675 (82.2 %) are male and 390,917 (17.8 %) are female. In 2011, 1,921,494 persons from 1,378,678 (25.4%) households were absent abroad of which males were 87.6% and females were 12.4%.
- The 2021 census also shows that 70.35 percent are economically active population and among the total usually economically active population, (93.05 percent) are usually employed.

- In addition, the 2021 census also shows that 32.9 percent of total absent population are migrating to India.
- The data from NDHS 2016 also shows that out of the migrated male population to India, 78.3% migrated for work whereas data from IOM 2022 shows only 67.9% migrated for work to India. This study took 73.3 percent Migrant as Male labor migrant (MLM).
- Out of the 73.3 percent migrant population, 81% (585026) are male.
- The population that falls under the fertile age group of 15-49 years has been considered for secondary analysis.
- After analyzing the data from different sources as stated above, average % by age the total male migrated population to India was extrapolated to different age group by district. This calculation shows that about 503422 Male population migrated to India for different purposes. Out of the total Male migrant i.e. 503422, 73.3% (368002) are Male Labor Migrants.
- For district level calculation, “proportion of absent population to India by district” as provided by CBOs was triangulated for MLM estimation.
- For calculation of lower limit and upper limit calculation, p value of 0.2% (ref: IBBS among MLM, 2024) and z-value of 2.58 for 95% CI has been considered.

## **3.18 Data Quality Control Measures**

Multiple quality check mechanisms were established, both at the central level and the field level. All data collectors were trained and tested regarding interviewing techniques and survey procedures. Meetings were regularly held to assess progress and identify and resolve any challenges arising during field operation. Questionnaires were checked for completion and quality before the end of the interview, and survey teams regularly conducted monitoring and supervisory visits and provided feedback.

## **3.19 Monitoring and Supervision**

Monitoring and supervision were conducted regularly during the field operation. A systematic monitoring schedule was developed, and survey monitoring was strengthened by continued communication between field teams and review sessions held regularly within each team, with the goal of reinforcing the training received and correcting any field operation errors. In addition to the internal supervision of each field team NCASC, SCI and other key partners also regularly monitored the field and ensured the field operation was as per the approved mapping protocol. A joint monitoring committee was formed using NCASC, SCI and other relevant stakeholders and monitoring visits were conducted to ensure the protocol was being followed. The monitoring visits were conducted in all ecological belts and in all districts, in close coordination with NCASC prior to any monitoring and supervision visits.

A standard monitoring form/checklist and matrix was used to systematically guide the monitoring activities. In addition to the field visit itself, other methods like telephone and email were also employed for monitoring visits. The monitoring visits focused on observing the data collection process, the quality of data being collected, and the adherence to protocols. To ensure the quality of the field operations, supervisory visits were also conducted using a supervision checklist.

## **3.20 Ethical Considerations**

Ethical approval was obtained from Nepal Health Research Council (NHRC) {Reference number: 1157} Ethical Review Board (ERB) prior to the start of the survey. Informed consent was sought from each participant before enrolling the participant in the survey. The purpose of the survey and the activities of the survey were explained in simple, understandable terms. As a result, the survey participants were well informed about their participation in the survey and able to make an informed decision about their participation. While communicating with individuals participating in the survey proper counseling was provided. The confidentiality of the collected information was also maintained. The research was conducted in compliance with ethical and human rights standards.

# CHAPTER IV: FINDINGS

This chapter presents estimates of the number of active hotspots and the estimated number of KP in all mapped districts and, along with extrapolated estimates for unmapped districts. It included finding all methods used for size estimation i.e. geographical mapping, capture recapture, service multiplier and network scaleup.

## 4.1 Findings from Geographical Mapping

### 4.1.1 FSW mapped districts

Kathmandu had the highest number of hotspots (320), followed by Dhanusha (151) and Kaski (105). The lowest number of FSW hotspots among mapped district was found in Palpa (4) and Doti (4).

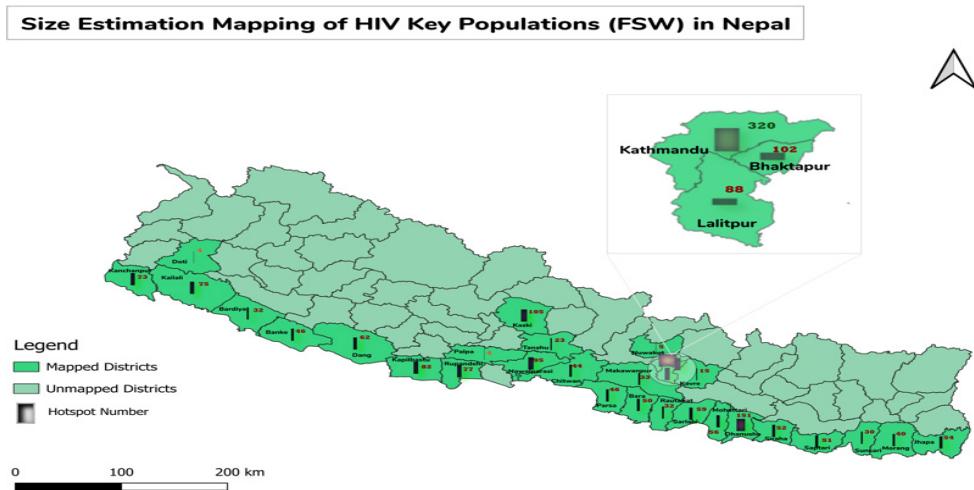

Figure 2: Number of FSW hotspots in the mapped districts

### 4.1.2 MSM & TG mapped districts

Parsa had the highest number of cruising sites for MSM & TG (160), followed by Sarlahi (155) and Kathmandu (154). The lowest number of MSM & TG hotspots among mapped district was in Kavre (5) and Nuwakot (5).

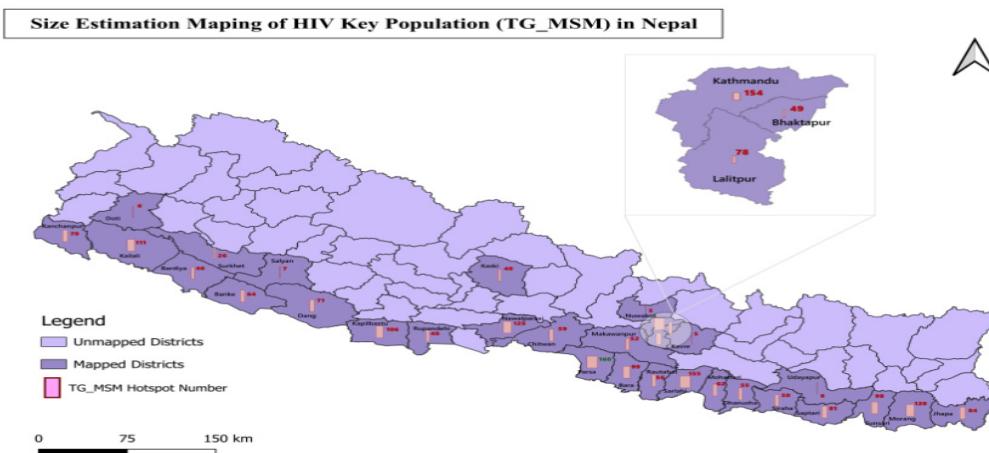

Figure 3: Number of MSM & TG hotspots in the mapped districts

### 4.1.3 PWID mapped districts

Kaski had the highest number of hotspots for PWIDs (277) followed by Kathmandu (213). The lowest number of PWID spots among mapped district was found in Nuwakot (6).

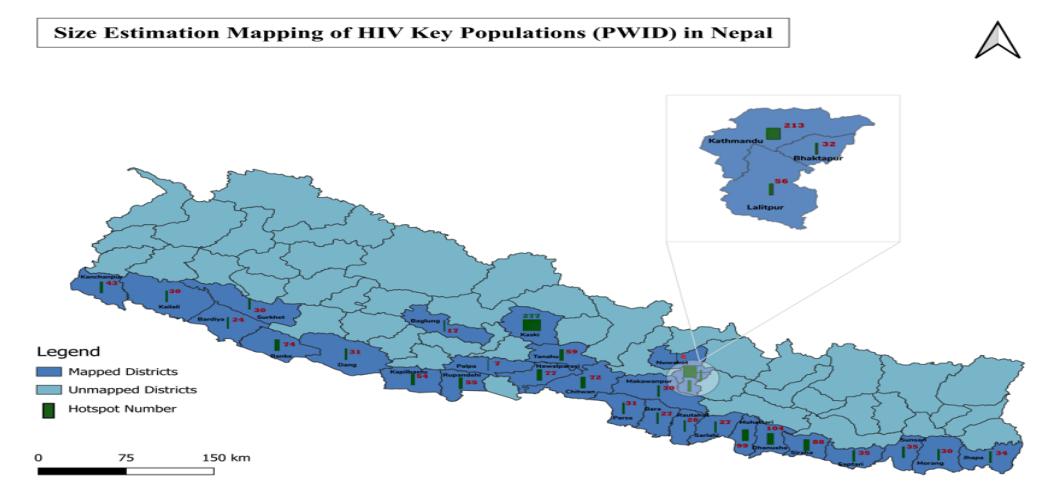

Figure 4: Number of PWID hotspots in the mapped districts

### 4.2 Extrapolation process

National level estimates include all districts in the country, both mapped and unmapped.

**Table 4: Summary of number of mapped, unmapped and extrapolated districts for FSWs, MSM/MSW/TG, and PWIDS**

Districts	Mapping Status		Mapping Result		Extrapolation required	
	Mapped	Unmapped	Zero	Non-zero	No	Yes
<b>FSWs</b>						
Program districts	28	-	-	28	28	-
Non-program districts	6	43	6	-	-	49
<b>Total</b>	<b>34</b>	<b>43</b>	<b>6</b>	<b>28</b>	<b>28</b>	<b>49</b>
<b>MSM/TG</b>						
Program districts	28	-	-	28	28	-
Non-program districts	6	43	2	4*	-	49
<b>Total</b>	<b>34</b>	<b>43</b>	<b>2</b>	<b>32</b>	<b>28</b>	<b>49</b>
<b>PWIDs</b>						
Program districts	30	-	-	30	30	-
Non-program districts	5	42	3	2*	-	47
<b>Total</b>	<b>35</b>	<b>42</b>	<b>3</b>	<b>32</b>	<b>30</b>	<b>47</b>

\*MSM/TG Non-zero/Non-program districts: Udaipur, Palpa, Salyan, Doti

\*PWIDs Non-zero/Non-program districts: Saptari, Palpa

## 4.2.1 Extrapolation Rules

The following rules were followed for the extrapolation.

- Mapped districts used their own results unless they were mapped as zero.
- Unmapped districts used the district they were matched to for extrapolation. If the district they were matched to was mapped as 'zero', the non-program district with the lowest number of KP (in terms of percentage of females aged above 15 for FSWs, or percentage of males age above 15 for MSM and above 15 for general population of PWIDS) was used as the source district for extrapolation. This was done assuming that the presence of KPs may be very low in some districts, it is unlikely to be zero (especially for MSM). This is supported by the fact that districts with no programs were far more likely to have zero values than districts with programs.
- The non-program districts with the lowest values were also used to extrapolate to the districts that were mapped as 'zero'.

## 4.3 National level estimates

Size estimates were calculated by applying several adjustment factors to the raw unadjusted estimates from the key informant interviews. After consolidating responses from multiple key informants at each hotspot, adjustments were applied to account for KPs who were double-counted, who came to hotspots less frequently than once a week, and who did not come to hotspots at all. The results presented in this section represent the estimates using all three adjustments, so they should be considered as the estimates of the districts.

### 4.3.1 National size estimates for FSWs

The national estimate of FSW is minimum 70,892 and maximum of 86,809. This estimate includes both mapped and unmapped district.

**Table 5: National size estimates of FSWs**

Districts	FSWs	
	Min	Max
Mapped	66,553	81,025
Unmapped	4,339	5,784
Total	70,892	86,809

### 4.3.2 District size estimates of FSWs

Table 6 presents the estimated number of FSWs from mapped and unmapped districts.

**Table 6: District size estimates of FSWs**

District	Establishment		Street		Home		Total	
	Min	Max	Min	Max	Min	Max	Min	Max

### 4.3.3 National size estimates for MSM/ TG/MSW/TGSW

The national estimate of MSM/MSW/TG/TGSW is minimum of 144,177 and maximum of 163,820. These estimates include both mapped and unmapped districts.

**Table 7: National size estimates of MSM/ TG/MSW/TGSW**

Districts	TGs		TGSW		MSM		MSW		Total	
	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.
Mapped	30,549	35,241	11,805	14,250	73,725	81,074	22,127	25,955	138,768	157,229
Unmapped	-	-	-	-	-	-	-	-	5,409	6,591
<b>Total</b>	<b>30,549</b>	<b>35,241</b>	<b>11,805</b>	<b>14,250</b>	<b>73,725</b>	<b>81,074</b>	<b>22,127</b>	<b>25,955</b>	<b>144,177*</b>	<b>163,820*</b>

\* Total minimum; difference of 562 [attributing to extrapolation done only in the total size estimation value]

\* Total maximum; difference of 709 [attributing to extrapolation done only in the total size estimation value]

#### 4.3.4 District size estimates of MSM/TGSW/MSM/MSW

Table 8 presents the estimated number of MSM/TGSW/MSM/MSW from mapped and unmapped districts.

**Table 8: District size estimates of MSM/TGSW/MSM/MSW**

District	TG		TGSW		MSM		MSW		Total	
	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max

## **4.5 Other Method Findings**

The results from the service multiplier, capture-recapture (CRC), and network scale-up methods, along with provincial and national-level estimates based on Bayesian synthesis and data extrapolation, are provided in Appendix 7.

# CHAPTER V:

# DISCUSSION AND CONCLUSION

## 5.1 Strengths

This survey employed multiple methods to map and estimate the size of key populations, including Geographical Mapping, Capture-Recapture, Network Scale-Up, Service Multiplier, and Hotspot Observations. These methods align with best practices for estimating key population sizes, enhancing the reliability and validity of the estimates. Future analyses could benefit from incorporating Bayesian models to further improve accuracy and provide more detailed estimates.

## 5.2 Limitations

**Hotspot-Based Limitations:** Mapping studies are restricted to hotspots where intervention programs are active, capturing a significant portion of KPs frequenting these areas but potentially missing those who visit less regularly or congregate in unmonitored locations.

**Key Informant Dependency:** The reliance on key informants (KIs) for estimating KP sizes rather than direct observation introduces potential inaccuracies, as these estimates may not fully reflect the actual population sizes.

**Definition Compliance:** Ensuring that individuals identified by KIs align accurately with KP definitions can be difficult, risking inclusion of non-target populations in estimates.

**Network Size Reporting Bias:** KP respondents may provide biased estimates of their social network sizes, which could result in an over- or under-estimation of KP sizes.

**Systematic Biases in PSE:** Reaching all KPs inherently presents challenges, and PSE studies are subject to systematic biases that are challenging to mitigate through statistical methods alone.

**Venue Reporting and Outreach:** There is a possibility that certain venues were missed by outreach workers, which could underestimate KP size estimates. Additionally, only venues with active outreach services were included, potentially excluding other relevant sites.

**Variability in Key Informant Estimates:** Key informant-based estimates can vary, with some respondents potentially overestimating or underestimating KP sizes at their venues.

**Stigmatization and Underreporting:** Due to stigmatization, KP members may underreport behaviors, leading to potential underestimation of actual KP sizes.

**Hotspot Congregation Limitations:** Estimates are based on KPs who gather at identifiable hotspots, excluding those who do not congregate at such sites and are thus not represented in multiplier and capture-recapture analyses.

**Mismatch in Multiplier-Based Estimates for FSW:** There are discrepancies in multiplier-based estimates for Female Sex Workers (FSW) as community-based organizations (CBOs) primarily distribute condoms to high-risk FSW, which may not accurately reflect the total FSW population.

**Capture-Recapture Assumptions:** Accurate population estimates from capture-recapture (CRC) depend on four assumptions: a closed population, independent captures, accurate capture

history, and homogeneous capture probability. Violation of these assumptions affects CRC accuracy. For example, not all members of target populations may have an equal chance of being tagged, leading to uneven distribution.

**Network Scale-Up (NSU) Biases:** NSU estimates depend on the extent to which KPs disclose behaviors to others within their social networks, introducing biases that have been corrected to some extent in the analysis.

**Comparability to Previous PSE Rounds:** Results are broadly comparable to the 2016 PSE round, with slightly higher estimates for FSW and PWID populations in 2024.

### 5.3 Conclusion

Despite its limitations, this survey's findings can guide programme planners to develop more targeted HIV prevention strategies and enhance programme coverage. The mapping exercise provides the detailed data of each mapped districts, including the number and list of hotspots (35 districts for FSW, 36 districts each for MSM/TG and PWID) along with PSE. While other methods used about 10 districts data for the estimations, the geographical mapping exercise covered all program districts. The findings were triangulated with routine program data and validated with representatives from the communities and program implementers. Therefore, these geographical mapping estimates serve as the primary data for program planning and implementation HIV prevention programs.

The knowledge gained from this survey supports to the development of micro plans to strategic service delivery. This PSE survey provides essential information about the size, distribution, and characteristics of KPs in a systematic and scientific manner. Importantly, the process involved civil society and community organizations representing and working with KPs, this leads to greater ownership of data and should result in more strategic delivery of services and increased uptake of interventions.

### 5.4 Recommendations

When implementing future IBBS, data should be collected on whether KPs visit outdoor venues or not, to obtain estimates of those who do not frequently visit hotspots. That would enable to obtain adjustment factors for a hidden population in the next round of mapping.

When conducting next round of mapping, we should ensure that all hotspots where KPs congregate are mapped, and not only those where outreach services are provided.

- Virtual mapping should be conducted to obtain estimates of the number of KPs that seek partners via virtual platforms. This would result in development of virtual interventions specific for this sub-set of KPs.
- Consideration should be done for further implementation of NSU as a PSE method when conducting health surveys in a general population.
- Continuation of implementation of multiple PSE methods and high-quality data collection by timely preparation of activities and robust selection and training of staff.

#### 5.4.1 Continuity of Bayesian Modeling for future PSE

- **Expand Bayesian Modeling:** Integrate multiple estimation methods through Bayesian modeling to create a single, reliable population estimate across different areas.

- **Apply Anchored Multiplier Widely:** Use the Anchored Multiplier with Bayesian modeling in more districts to get a broader, representative population estimate.
- **Use Bayesian Estimates to Adjust Programs:** Update programs based on Bayesian estimates, targeting underserved and high-risk areas effectively.
- **Plan for Future Scenarios:** Apply Bayesian modeling to assess potential changes in population sizes, preparing for shifts due to factors like urbanization and migration.

# APPENDICES

## Appendix 1: List of Mapped districts

S. No	Province	District
1.	Bagmati	Bhaktapur
2.	Bagmati	Kathmandu
3.	Bagmati	Kavre
4.	Bagmati	Lalitpur
5.	Bagmati	Makwanpur
6.	Bagmati	Nuwakot
7.	Bagmati	Chitwan
8.	Madhesh	Bara
9.	Madhesh	Siraha
10.	Madhesh	Saptari
11.	Madhesh	Dhanusha
12.	Madhesh	Mahottari
13.	Madhesh	Parsa
14.	Madhesh	Rautahat
15.	Madhesh	Sarlahi
16.	Province 1	Udaipur
17.	Province 1	Jhapa
18.	Province 1	Morang
19.	Province 1	Sunsari
20.	Sudurpaschim	Doti
21.	Sudurpaschim	Kailali
22.	Sudurpaschim	Kanchanpur
23.	Karnali	Salyan
24.	Karnali	Surkhet
25.	Gandaki	Baglung
26.	Gandaki	Kaski
27.	Gandaki	Tanahun
28.	Gandaki	Nawalparasi East
29.	Gandaki	Mustang
30.	Lumbini	Kapilvastu
31.	Lumbini	Nawalparasi West
32.	Lumbini	Rupandehi
33.	Lumbini	Banke
34.	Lumbini	Bardiya
35.	Lumbini	Dang
36.	Lumbini	Palpa

## Appendix 2: Formulas used for applying adjustment

### Analysis of programmatic mapping data

The following formula was used to adjust for mobility:

$$S_2 = S_1 (1 - p_1) + (S_1 * p_1 / m_1)$$

$S_2$  = estimated number of KP individuals at a venue adjusted for mobility

$S_1$  = crude number of KP individuals at a venue

$p_1$  = proportion of KP individuals that visit more than one venue on a peak day

$m_1$  = mean number of venues that KP members visit on a peak day

The following formula was used to further adjust for the population that is hidden:

$$S_3 = S_2 (1 - p_2)$$

$S_3$  = estimated number of KP individuals at a venue adjusted for mobility and the hidden population

$S_2$  = number of KP individuals at a venue adjusted for mobility

$P_2$  = proportion of KP individuals that are hidden, i.e., do not visit venues that are mapped

The adjusted estimates for each KP were divided by the size of the total male and female population using census data, to obtain population proportions.

## Appendix 3: Questionnaire

### L2 Formats

1	Type of Key Informant <b>(Please identify and select the respondent KP or Non_KP, who can give best information about this hotspot)</b>	KP FSW	1
		Taxi Driver	2
		Client	3
		Pimp	4
		Staff of NGO/CBO/ Outreach Worker	5
		Street Vender (Chai, Paan)	6
		Establishment Owner/Manager	7
		Security Guard/Bouncer	8
		Establishment Staff/Bar or club worker	9
		Hairdresser	10
		Police	11
		Other (specify)	96
1a	How old are you: _____ years <i>If younger than 18 years, please end the interview.</i>		
1b	Visit of this hotspot: Visit one(Capture one)_____1 visit two (Capture two)_____2 Visit three (Capture three)_____3		
1c	Do females visit this hotspot to look for clients to have sex in exchange for money or goods? <b>INTERVIEWER: If respondent says no or don't know, or no response, please end the interview .</b>	Yes	1
		No	2
		Don't know	8
		No response	9
2	Select the code that best describes the type of hotspot	Disco	12
		Dance Bar	13
		Restaurant	14
		Massage Parlor	15
		Local Bar/Bar	16
		Dohori	17
		Hotel/Lodge	18
		Casino	19
		Khaja ghar/snacks outlet	21
		Cinema Hall	96
		Beauty Parlor	
<b>INTERVIEWER:</b> If coded 1 in q1 (and respondent is KP) continue the interview if coded 2 to 96 in q1(respondent is non KP), skip to Q4 .			
<b>Capture 1:</b>			
2a	Have you been already approached and interviewed by staff from the organization INPL like me (Please show your ID card) in the past 30 days, and who are working on the study that aims to estimate the number of FSW in this area?  <i>If yes, please end the interview.</i>	Yes	1
		no	2

3f	Sometimes men give money or gifts to women for sex. Has a man other than your main partner given money or valuable goods to you in the past 12 months for having sex with him? <b>If yes, skip to Q4, If no and "Don't know", please end the interview</b> Please circle one .  <b>INTERVIEWER: If respondent says no or don't know, please end the interview .</b>	Yes No	1 2
	goods to you in the past 12 months for having sex with him? <b>If yes, skip to Q4, If no and "Don't know", please end the interview</b> Please circle one .  <b>INTERVIEWER: If respondent says no or don't know, please end the interview .</b>	Don't know	8
	Capture 2 : Ask this section for the respond if coded 1 in q1 and coded 2 in q1b		
3c2	Sometimes men give money or gifts to women for sex. Has a man other than your main partner given money or valuable goods to you in the past 12 months for having sex with him?  If no and "Don't know", please end the interview .	Yes	1
		No	2
		Don't know	8
C2a	Have you been already approached by staff from the organization INPL like me (show your ID card0 in the past two days, and who are working on the study that aims to estimate the number of FSW in this area? Have they offered you a _____ ( <i>mention here the object or show here capture 2 object</i> )?  <b>If no, continue and if yes, end the interview.</b>	Yes	1
		no	2
C2b	Can I please give you this object? Can you please keep this object with you in the following 4 weeks and remember that you received it? You might be asked whether you received it in the following 2-3 weeks by another outreach worker at this or another site in this city. Please do not give it to another person.  <b>If accepted the object, Give a respondent an object for Capture 2</b>  <b>If refused the object, End the interview .</b>	Accepted the object	1
		Refused the object	2
C2c	Did you receive an object from the INPL staff like me (show your ID card) last week?  <b>If yes, continue, if no, skip to Q4 and If refuse to answer, End the interview .</b>	yes	1
		no	2
		Refuse to answer	3
C2d	Can you please show me this object? If Respondent showed the right object, end the interview . <b>If Refuses to show, End the interview .</b>	Respondent showed the right object	1
		Respondent says she got the object but does not have it with her	2
		Refuses to show	3
C2e	Can you please have a look at this card and tell me which object you received? <b>Show a respondent a laminated card</b> If refuse to answer, <b>End the interview .</b>	Showed an appropriate object	1
		Showed a wrong object	2
		Refuses to show	3
	Capture 3: : Ask this section for the respond if coded 1 in q1 and coded 3 in q1b .		
3c3	Sometimes men give money or gifts to women for sex. Has a man other than your main partner given money or valuable goods to you in the past 12 months for having sex with him? <b>If no and "Don't know", please end the interview .</b>	Yes	1
		No	2
		Don't know	8

C3a	Have you been already approached by staff from the organization INPL like me ( <i>show your ID card</i> ) in the past two days, and who are working on the study that aims to estimate the number of FSW in this area? Have they offered you – ( <i>mention here the object, or show the capture 3 object</i> )?  <b>If no, continue</b>  <b>if yes, end interview.</b>	yes	1
		no	2
C3b	Did you receive an object from the INPL staff like me ( <i>show your ID card</i> ) two weeks ago? <b>If yes, continue,</b> <b>if no, skip to qC3e</b> <b>and If refuse to answer, end the interview .</b>	yes	1
		no	2
		Refuse to answer	3
C3c	Can you please show me this object? If Respondent showed the right object, skip to qc3e, <b>If Refuses to show, End the interview If respondent says she got the object but does not have it with her, continue .</b>	Respondent showed the right object	1
		Respondent says she got the object but does not have it with her	2
		Refuses to show	3
C3d	Can you please have a look at this card and tell me which object you received? <b>Show a respondent a laminated card.</b> <b>If refuse to answer, End the interview .</b>	Showed an appropriate object	1
		Showed a wrong object	2
		Refuses to show	3
C3e	Did you receive an object from the outreach worker a week ago? <b>If yes, continue,</b> <b>If a person did not receive any objects so far (if if coded 2 in this question and also code 2 in qC3b skip to Q4</b>  <b>If refuse to answer, End the interview .</b>	yes	1
		no	2
		Refuse to answer	3
C3f	Can you please show me this object? If respondent showed the object end the interview . If Respondent says she got the object but does not have it with her, continue. <b>If Refuses to show, End the interview .</b>	Respondent showed the right object	1
		Respondent says she got the object but does not have it with her	2
		Refuses to show	3
C3g	Can you please have a look at this card and tell me which object you received? <b>Show a respondent a laminated card.</b> <b>If refuse to answer, End the interview.</b>	Showed an appropriate object	1
		Showed a wrong object	2
		Refuses to show	3
4	During an average week, how many female sex workers usually come to this hotspot to look for clients? ( <b>Please provide a range.</b> <b>If respondent does not know or does not give any response, please code 888 or 999 respectively).</b>  <b>INTERVIEWER: If respondent says don't know or does not respond, please end the interview .</b>	<input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
5	During an average week, how many female sex workers who come to this hotspot also go to other hotspot to look for clients? By other hotspot I mean Discos, Dance Bars, Cabin Restaurants, Massage Parlors, Local Bars, Dohoris, Hotel/Lodges, Casinos, Restaurants, Cinema Hall, Beauty Parlors or any other similar venue. <b>Please provide a range. If respondent does not know or does not give any response, please code 999.</b>	<input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX

6	Among those female sex workers who also go to other venues ( <b><i>please refer to Q5</i></b> ), on average <b>how many venues</b> do you think they go to during <b>an average week</b> , including this one?  <b><i>Please provide a range. If respondent does not know or does not give any response please code 999.</i></b>	<input type="text"/> <input type="text"/> <input type="text"/>	<input type="text"/> <input type="text"/> <input type="text"/> MIN MA X
7	Among sex workers who come to this hotspot, how many of them come weekly? Biweekly? Monthly, Ect?  <b>INTERVIEWER: Please read each response and fill in the number. Do not leave any box blank.</b>  <b><i>Please make sure that the max and min values previously recorded in Q4 are satisfied (i.e. sum of the mins should add up to the min in Q4 and sum of the maxes should add up to the max in Q4).</i></b>	At least once a week  <input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
		Less than once a week but at least once in a month  <input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
		Around once a month  <input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
		Less than once in a month but more than once in three months  <input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
		Less than once in three months but more than once in six months  <input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
8	How many sex workers who come to this hotspot ( <b><i>refer to Q4</i></b> ) do you think also go to other districts to look for client?  <b><i>If respondent does not know or does not give any response please code 888 or 999 respectively.</i></b>	<input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
9	How many FSW do you know who live or work in this district?  <b><i>Please provide a range. If respondent does not know or does not give any response please code 888 or 999 respectively.</i></b>  <b>INTERVIEWER: If response is 0, 888 or 999, skip to Q10.</b>	<input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
10	How many of the FSW that you know who live or work in this district ( <b><i>refer to Q9</i></b> ) do not EVER come to ANY hotspots to look for clients?  <b><i>Please provide a range. If respondent does not know or does not give any response please code 888 or 999 respectively.</i></b>	<input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX
11	How many sex workers who come to this hotspot ( <b><i>refer to Q4</i></b> ) do you think use social media or websites to look for clients?  <b><i>Please provide a range. If respondent does not know or does not give any response please code 888 or 999 respectively.</i></b>	<input type="text"/> <input type="text"/> <input type="text"/> MIN	<input type="text"/> <input type="text"/> <input type="text"/> MAX

	Service multiplier (Ask the following questions only for FSW KP)		
12	In the past 6 months (from DecemberDecember 2023 – MayMay 2024), have you received condoms from the NGO _____ ( <i>name here of the service provider NGO of (sample districts from the list provided) that has data for the multiplier</i> )?	yes	1
		no	2
13	In the past 6 months (from DecemberDecember 2023 – MayMay 2024), were you tested for HIV by staff of the NGO _____ ( <i>name here of the NGO that has data for the multiplier</i> )?	yes	1
		no	2
14	In the past 6 months (from DecemberDecember 2023 – MayMay 2024), were you tested for syphilis by staff of the NGO _____ ( <i>name here of the NGO that has data for the multiplier</i> )?	yes	1
		no	2
15	Do you also find clients using virtual venues such as social apps, facebook, or whatsapp or some other internet pages? If no skip to Q17.	yes	1
		no	2
16	Which social media/ mobile app/website do you use to contact clients? <b>(Select all apply)</b>	Imo	A
		WhatsApp	B
		Facebook	C
		messengers	D
		Instagram	E
		Other (specify)_____	X
17	<b>(Display only for Capture1 of recapture sample districts)</b> Can I please give you this object? Can you please keep this object with you in the following 4 weeks and remember that you received it? You might be asked whether you received it in the following 1-2 weeks by another INPL staff at this or another site in this city. Please do not give it to another person. <i>Give a respondent an object for Capture 1.</i>	Accepted the object	1
		Refused the object	2

## Appendix 7: Findings of other methods

### Findings of Multiplier method

Tables below show the PSE based on the service multiplier method in districts where data collection was done, along with the number of KPs that were given certain services, as per programmatic data obtained from NGOs. The percentage of KPs that reported receiving a service is shown in Appendix 6.

Table 19 shows that the percentage of FSW in the general population of females older than 18 years based on the multiplier method ranged from 0.04% to 0.36% for the first multiplier indicator (receipt of condoms in the past 6 months), 0.04%-0.28% for the second (having an HIV test in the past 6 months) and 0.04%-0.24% for the third (syphilis test in the past 6 months). The highest prevalence of FSW is in the Dhanusha district of the Madhesh province. The highest absolute number of FSW was found in Kathmandu. In some districts, the programme count is very similar to the estimated size of FSW, which implies that there is a dependency between two data sources.

**Table 19: Estimated number of FSW based on the service multiplier and the percentage of FSW in the general population of women older than 18 years**

PSE\_Est= estimated number of a KP; PSE\_LL= lower level of the credible interval; PSE\_UL= upper level of the credible interval; % GP= percentage of a KP in a general population older than 18 years; % LL= lower level of the credible interval of the percentage of a KP in a general population older than 18 years; % UL = upper level of the credible interval of the percentage of a KP in a general population older than 18 years;

Table 20 shows that the percentage of MSM in the general population of men older than 18 years based on the multiplier method ranged from 0.07% to 0.33% for the first indicator (receipt of condoms), 0.04%-0.13% for the second (HIV test in the past 6 months), 0.03%-0.11% for the third (syphilis test) and 0.07%-0.33% for the fourth (receipt of lubricants). The highest prevalence is in the Dhanusha district of the Madhesh province and the highest absolute number of MSM was found in Kathmandu. The size of MSM seems to be substantially under-estimated, possibly due to high dependency between two data sources and non-inclusion of MSM who do not visit outreach venues.

**Table 20: Estimated number of MSM based on the service multiplier and the percentage of MSM in the general population of men older than 18 years**

PSE\_Est= estimated number of a KP; PSE\_LL= lower level of the credible interval; PSE\_UL= upper level of the credible interval; % GP= percentage of a KP in a general population older than 18 years; % LL= lower level of the credible interval of the percentage of a KP in a general population older than 18 years; % UL = upper level of the credible interval of the percentage of a KP in a general population older than 18 years;

Table 21 shows that the percentage of TGW in the general population of men older than 18 years based on the multiplier method ranged from 0.02% to 0.19% for the first indicator (receipt of condoms), 0.02%-0.09% for the second indicator (HIV test in the past 6 months), 0.01%-0.08% for the third (syphilis test) and 0.02%-0.19% for the fourth (receipt of lubricants). The highest prevalence is in the Dhanusha district of the Madhesh province and the highest absolute number of TGW was found in Kathmandu. Overall, there is little difference between the programme counts and the estimated population size.

**Table 21: Estimated number of TGW based on the service multiplier data and the percentage of TGW in the general population of men older than 18 years**

Table 22 shows that the percentage of PWID in the general population of men older than 18 years ranged from 0.1% to 1.15% for the indicator on the receipt of condoms, 0.07%-0.91% for an HIV test in the past 6 months, and 0.1%-0.56% for receipt of syringes. The highest prevalence of PWID is in the Dhanusha and Banke districts. The highest estimated size was found in Gandaki for the first indicator, while for other two indicators in Kathmandu. Overall, there is more pronounced difference between the programme counts and the estimated population size for PWID compared to other KPs.

Bagmati_Kathmandu	1465	761	3181

## Findings from Network scale-up

The average size of social networks of the general population in Nepal, as obtained from a survey in male migrant workers, is 200 people (93 men and 107 women).

Table 27 shows the NSU-based PSE of FSW, which ranged from 0.26% to 4.88% across the provinces. The correction factor applied to correct for biases was 4.4 (4.34-4.45).

**Table 27: Estimated number of FSW based on the NSU**

Province	Est number	LL	UL	Est %	LL	UL
Lumbini	4.194	4.085	4.296	0,26	0,25	0,27
Bagmati	28.631	27.918	29.287	1,40	1,36	1,43
Gandaki	9.504	9.263	9.726	1,00	0,98	1,03

LL= lower level of the 95% credible interval

UL= upper level of the 95% credible interval

## Provincial and National level PSE

This section shows the final PSE – the estimated absolute numbers with 95% credible intervals and the prevalence of KPs in the general population in Nepal, based on the Bayesian synthesis and data extrapolation. District-level PSE are shown in the Appendix.

Table 32 shows that the estimated prevalence of FSW at the national level was 0.76% (0.66-0.87), ranging from 0.27% to 1.32% across the provinces.

**Table 32: Estimated number of FSW per province and the prevalence of FSW in the general population of women older than 15 years**

Province	Est number	LL	UP	Est %	LL	UL
Bagmati	26.964	23.650	30.609	1,32	1,16	1,50
Gandaki	8.656	7.286	10.169	0,91	0,77	1,07
